**By Neale Monks, Philip Palmer : Ammonites (Living Past)** what we can do with the geological past is use earths history to learn how life reacted to events in the past to help to predict how we are dealing with the future ammonites were predatory mollusks that resembled a squid with a shell these cephalopods had eyes tentacles and spiral shells they

are more closely related to a Ammonites (Living Past):

1 of 1 review helpful Inadequate for the advanced collector and too technical for the general reader By clarence ellis I fear I was hoping for better information to enable me to refine the identification of specimens in my collection I didn't get it I did get some good information on the biology of ammonites which I appreciated The photos and drawings are quite good The authors tried to walk the tight wire between Ammonites often have artistic mythological and religious associations though the reality is much more down to earth They are cephalopods represented in today's seas by such animals as nautilus octopus squid and cuttlefish Since they are extinct it is only through the study of their fossils and by observing their living relatives that we can piece together something of their anatomy their habitat and their ecology One recent significant shift in understanding About the Author Neale Monks is a palaeontologist at The Natural History Museum in London and has written a number of papers on the evolution of heteromorph ammonites Phil Palmer was a scientist at The Natural History Museum in London until his retirement and
